Holocene climatic optimum - Wikipedia
The Holocene Climatic Optimum (HCO) was a warm period that occurred in roughly the interval roughly 9,000 to 5,000 years BP, with a thermal peak around 8,000 years BP. It has also been known by many other names as well, such as Allthermal Climatic Optimum, Holocene Megathermal, Holocene Optimum, Holocene Thermal Maximum, Hypothetical, and Mid...

Climate - Wikipedia
Climate is the long-term pattern of weather in an area, typically averaged over a period of 30 years. More rigorously, it is the mean and variability of meteorological variables over a time spanning from months to millions of years. Some of the meteorological variables that are commonly measured are temperature, humidity, atmospheric pressure, wind, and precipitation.

Evidence of Global Warming & The End of the Last Ice Age
The climatic seaweeding of global temperatures is one of the most mysterious periods of earth's prehistory. As the planet fell back full in glacial conditions, temperatures dropped as low as they had during the peak of the last ice age 21,000 years ago.

The bottom graph shows that even in the last 10,000 years there are significant natural fluctuations in global average temperatures. The figure above shows that variations in the global average temperatures over the Holocene period have been relatively small compared to the ice age cycles, especially over the last 10,000 years.

Ice Age - World History Encyclopedia
A natural ice age is a period during which the earth's climate is colder than normal, with ice sheets covering the poles and glaciers dominating higher latitudes. Within an ice age, there are varying pulses of colder and warmer climatic conditions, known as 'glacials' and 'interglacials'. Even within the interglacials, ice continues to cover at least one of the poles.

A precis de dendrochronological time scale has been developed for the Holocene, for instance helping to construe a Medieval Climatic Anomaly from CE 900 to 1200, below average temperatures during the Little Ice Age from CE 1200 to 1850, and warming since CE 1850 (Epp et al., 2002, Wiles et al., 2016). Climate change: past and future - Discovering Antarctica
Because there is a shift of about 1 degree of latitude for each 1°C change in mean annual air temperature, the Byrd ice core shows temperature fluctuations on the order of 15°C over the past 100,000 years. You can find out more about ice coring, an important procedure for stabilizing ice cores, as well as about how other forms of evidence are extracted.
